A Sublinear Bound on the Chromatic Zeros
of Theta Graphs

David G. Wagner

Abstract  Let $\Theta = \Theta(m_1, \ldots, m_k)$ denote a graph consisting of two vertices $u, v$ and $k$ internally-disjoint $uv$-paths of lengths $m_1, \ldots, m_k$. We exhibit an implicitly-defined function $R(k)$ such that every complex zero $z$ of the chromatic polynomial of $\Theta$ satisfies $|z - 1| < R(k)$, and show that $R(k)$ is sublinear as $k \to \infty$.
