# Data Profiling: Classification of Tasks

Felix Naumann  
Data Profiling

## Use Cases for Data Profiling

---

- **Query optimization:** Counts and histograms, functional dependencies, ...
- **Data cleansing:** Patterns, rules, and violations
- **Data integration:** Cross-DB inclusion dependencies
- **Scientific data management:** Inspect new datasets
- **Data analytics and mining:** Profiling as preparation to decide on models and questions
- **Database reverse engineering**
  
- “If we just have a bunch of data sets in a repository, it is unlikely anyone will ever be able to find, let alone reuse, any of this data. With adequate metadata, there is some hope, but even so, challenges will remain...”

Felix Naumann  
Data Profiling  
Canada, 2017

***Data preparation accounts for about 80% of the work of data scientists***

#### What data scientists spend the most time doing

- *Building training sets: 3%*
- *Cleaning and organizing data: 60%*
- *Collecting data sets; 19%*
- *Mining data for patterns: 9%*
- *Refining algorithms: 4%*
- *Other: 5%*

# Shortcomings of commercial and research tools

## ■ Usability

- Complex to configure
- Results complex to view and interpret

## ■ Scalability

- Main-memory based
- SQL based

## ■ Efficiency

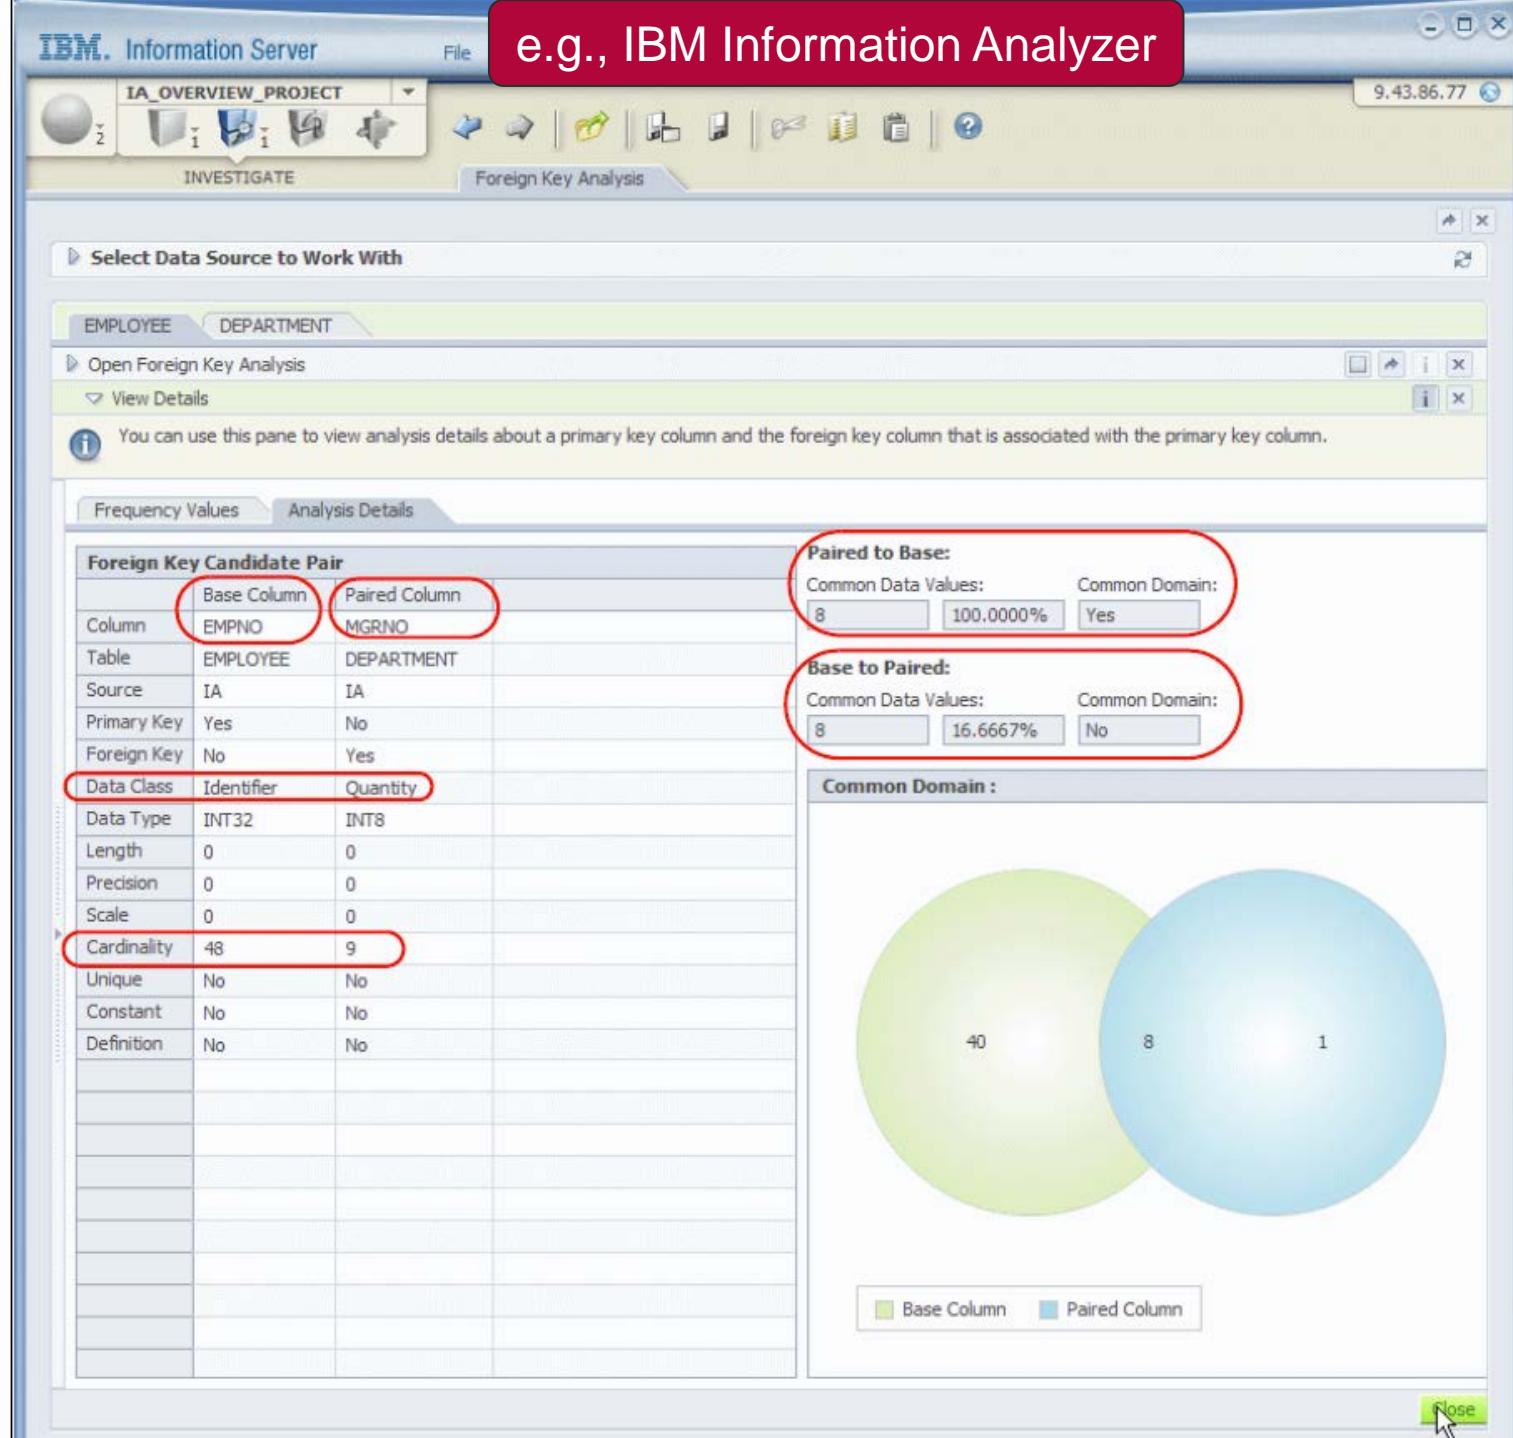

- Coffee, Lunch, Overnight

## ■ Functionality

- Restricted to simplest tasks
- Restricted to individual columns or small column sets
- „Checking“ vs. „discovery“

## ■ Interpretation of profiling results

e.g., IBM Information Analyzer

## Scalable profiling

- Scalability in number of rows
- Scalability in number of columns
  - “Normal” table with 100 columns:  
 $2^{100} - 1 = 1,267,650,600,228,229,401,496,703,205,375$   
= 1.3 nonillion column combinations
  - Impossible to check or even enumerate
- Possible solutions
  - Scale up: More memory, faster CPUs
  - Scale in: More cores
  - Scale out: More machines
  - Scale smart: Intelligent enumeration and aggressive pruning

## Benford Law Frequency , a.k.a. "first digit law"

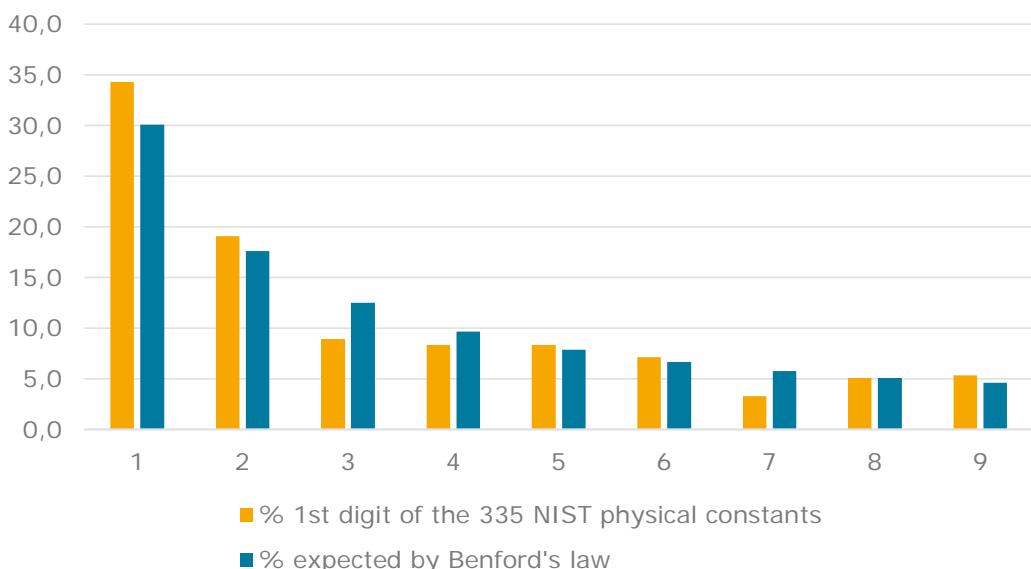

- Statement about the distribution of first digits  $d$  in (many) *naturally occurring* numbers:
  - $P(d) = \log_{10}(d + 1) - \log_{10}(d) = \log_{10}(1 + \frac{1}{d})$
  - Holds if  $\log(x)$  is uniformly distributed

Felix Naumann  
 Data Profiling

## Examples for Benford's Law

- Surface areas of 335 rivers
- Sizes of 3259 US populations
- 1800 molecular weights
- 5000 entries from a mathematical handbook
- 308 numbers contained in an issue of Reader's Digest
- Street addresses of the first 342 persons listed in American Men of Science

## Uses for FDs

- Schema design
  - Normalization
  - Keys
- Data cleansing
- Schema design and normalization
- Key discovery
- Data cleansing (especially partial/conditional FDs)
- Anomaly detection
  - Data integrity constraints
  - Data curation rules
- Query optimization: Independence of column attributes
- Index selection

### Naive discovery approach

- For each column combination X
  - For each pair of tuples  $(t_1, t_2)$ 
    - If  $t_1[X \setminus A] = t_2[X \setminus A]$  and  $t_1[A] \neq t_2[A]$ : Break
- Complexity
  - Exponential in number of attributes times number of rows squared

## IND discovery $R[X] \subseteq S[Y]$

- Unary and n-ary INDs:  $R[A] \subseteq S[B]$  and  $R[ABC] \subseteq S[DEF]$

- Detect unknown foreign keys
- Example: PDB – Protein Data Bank
  - OpenMMS provides relational schema, 175 tables
  - Not a single foreign key constraint!
- Example: Ensembl – genome database
  - Shipped as MySQL dump files: >200 tables
  - Not a single foreign key constraint!
- Web tables: No schema, no constraints, but many connections
- Why are FKs missing?
  - Lack of support for foreign key constraints in DBMS
  - Fear of performance drop for constraint checking
  - Lack of database knowledge

**Unary IND detection:**

$O(n^2)$

for n attributes

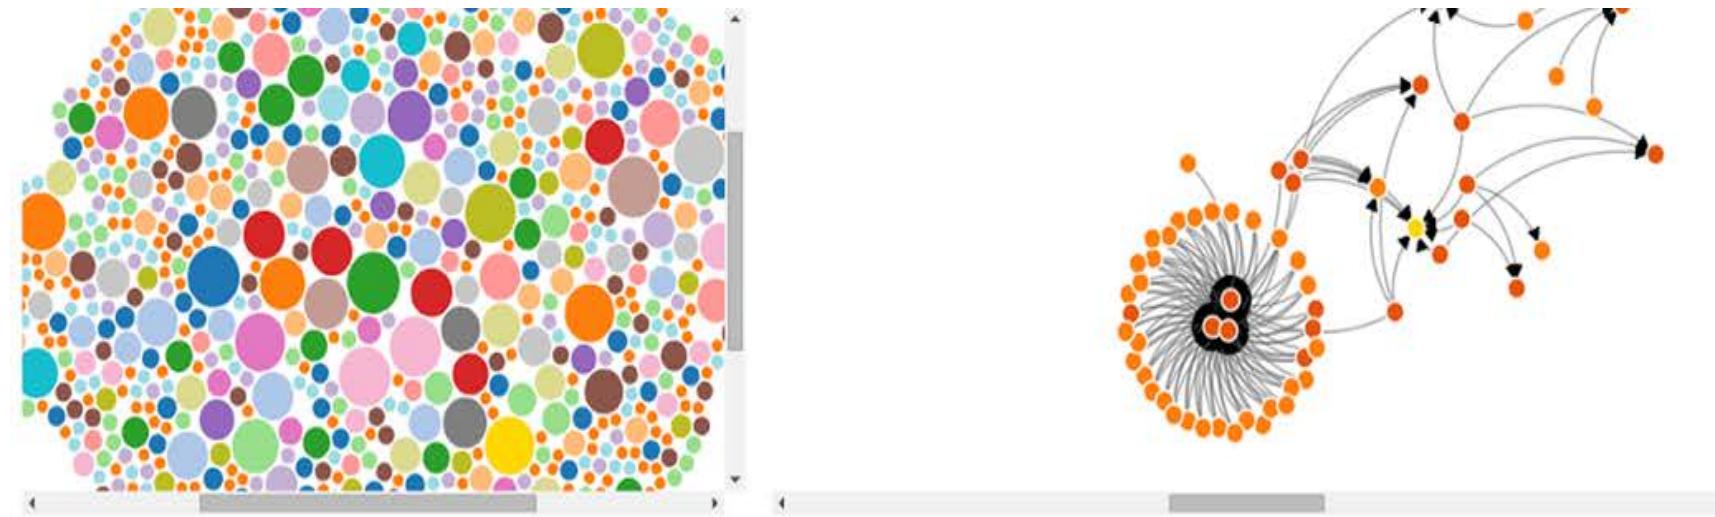

**N-ary IND detection:**

$O(2^n \cdot n!)$

for n attributes

## Other dependencies

- Detecting multi-valued dependencies (MVDs) and join dependencies
- Detecting denial constraints (DCs)

- Detecting order dependencies (ODs)

□ `SELECT emp_name  
FROM employees  
ORDER BY rank, salary`

□ `SELECT emp_name  
FROM employees  
ORDER BY rank`

Remove rank

Replace with  
salary (if index  
only on salary)

emp_name	rank	salary
Smith	1	40k
Johnson	1	40k
Williams	1	45k
Brown	2	60k
Davis	2	60k
Miller	3	70k
Wilson	4	100k

salary „orders“ rank

## Partial dependencies

- Aka. “approximate dependencies”

  - For all but 10 of the tuples
  - Only for 80% of the tuples
  - Only for 1% of the tuples
- Also: Approximate dependencies
- Conditional dependencies
- Matching dependencies

## Conditional Dependencies

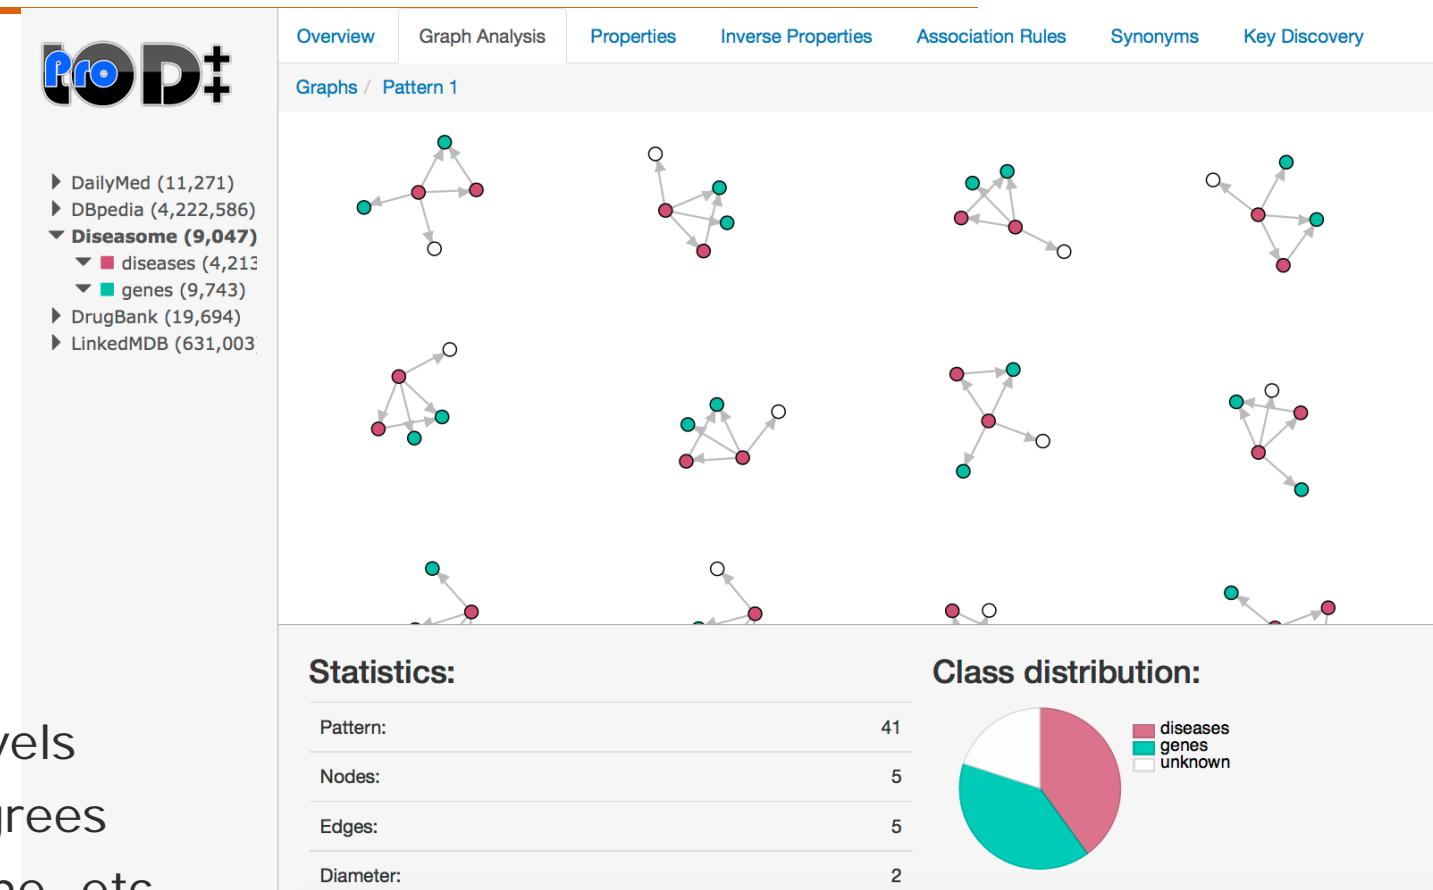

---

- Given a partial IND or FD: For which part does it hold?
- Expressed as a condition over the attributes of the relation
  
- Problems:
  - Infinite possibilities of conditions
  - Interestingness:
    - Many distinct values: less interesting
    - Few distinct values: surprising condition – high coverage
  
- Useful for Integration
  - Cross-database cINDs

## Outlook: Profiling new types of data

- Traditional data profiling:  
Single table or multiple tables
- More and more data in other models
  - XML / nested relational / JSON
  - RDF triples
  - Textual data: Blogs, Tweets, News
  - Multimedia data
- New dimensions to profile
  - XML: Measures at different nesting levels
  - RDF: Graph structure, in- and out-degrees
  - Multimedia: Color, video-length, volume, etc.
  - Text: Sentiment, sentence structure, complexity, and other linguistic measures

## Outlook: Profiling Challenges

---

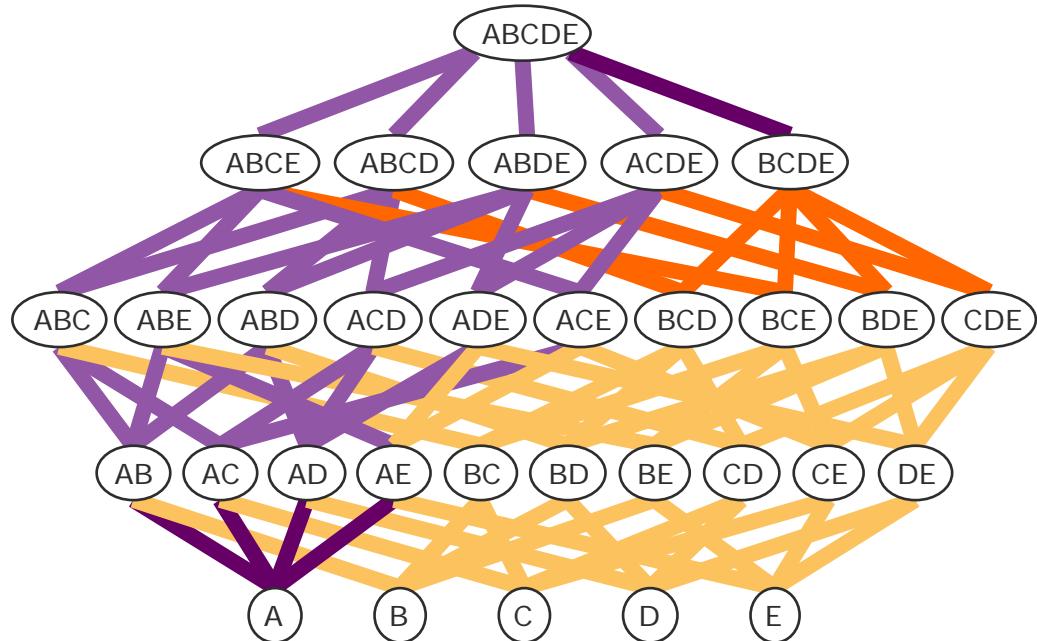

- Efficient profiling
- Scalable profiling
- Holistic profiling
- Incremental profiling
- Online profiling
- Temporal profiling
- Profiling query results
- Profiling new types of data
- Data generation and testing
- Data profiling benchmark
  
- Hundreds of UCCs – which ones are keys?
- Thousands of FDs – which ones are true?
- Millions of INDs – which ones are foreign keys?
  
- User-driven interpretation:
  - Rank and visualize metadata
- Machine-driven interpretation
  - Machine learning
