Course Objectives:

This is the second course in macroeconomics theory sequence and provides an extension of the tools developed in Macroeconomic theory 1. The objective of this course is to present a full coverage of modern macroeconomic theories and develop basic models to analyze both short run and long run phenomena in a closed economy. The questions of concern will include: Why are so many countries poor? What policies might help them to grow out of poverty? What causes recessions? Can the government do anything to combat recessions? Should it? What are the sources of economics booms and recessions? Why is there unemployment? What are the sources of inflation? And, how do government policies affect output, inflation and unemployment? We will discuss the standard analytical methods used in macroeconomics that address these issues and provide a rigorous treatment of

macroeconomic theories. We will closely look at the underlying micro foundations of macroeconomic theories and emphasize on the role of expectations. Topics will include the neoclassical growth models, real business cycles models, government spending and government debt, consumption, investment, models involving money and issues related to inflation. After completion of this course students will learn how these theoretical frameworks can be used to understand and interpret actual macroeconomic events.
