The focus of this course is to understand the key macroeconomic variables such as gross domestic product (GDP), inflation, unemployment rate, nominal and real interest rate, savings, investment, and exchange rate and how these variables are influenced by both monetary and fiscal policies of the government. The course will cover both short run fluctuations in the economy (business cycles) and long run trends (economic growth). The macroeconomic theories will be used to understand the workings of different economies of the world with special emphasis on Canadian economy. After completion of this course, the students will learn how macroeconomic models are build to explain the economy, the relationships among major macroeconomic variables in simple models; be able to make distinction between short run and long run; and finally evaluate the nature and impacts of economic problems and policies.
