

# **ECE 604 Stochastic Processes**

Fall 2022

**Instructor:** Weihua Zhuang, EIT 4156, x35354, email:wzhuang@uwaterloo.ca

**Lectures:** Wednesdays, 11:30am-2:20pm, EIT3141

**Office Hour:** Wednesdays, 2:30-3:30pm @ EIT 4156

**Prerequisite:** ECE206 or equivalent (subject to the approval of instructor)

**Text:** Sheldon M. Ross, Introduction to Probability Models, 11th ed., Academic Press, 2014

This course studies fundamentals in probability theory and random processes. It is strongly recommended that students in communications, networks, signal processing, control, and other related areas should take this course.

## **Course Outline:**

- Review: probability and conditional probability, random variables, probability density function, probability mass function, cumulative distribution function, mean and variance, moment generating functions.
- Convergence concepts: convergence in mean square, convergence almost everywhere, convergence in probability, convergence in distribution.
- Markov chains: Chapman-Kolmogorov equations, time reversibility, Markovian decision process.
- Poisson processes: exponential distribution, Poisson process, generalization of the Poisson process.
- Continuous-time Markov chains: birth and death process, transition probability function, time reversibility, uniformization.
- Renewal processes: limit theorems, renewal reward process, regenerative process.
- Stationary processes: Brownian motion, white noise, Gaussian process, stationary process.

**Grading:** Midterm Examination = 30%, Final Examination=70%.
