

Using Pyrene Fluorescence to Probe the Behaviour of Semicrystalline Polyolefins in Solution

Solmaz Pirouz and Jean Duhamel

Department of Chemistry

University of Waterloo

May 21st, 2014

Introduction

Engine oils are vital to all cars as they provide the lubrication needed between the moving parts of the engine.

Problem: At high temperatures, liquids become thinner. On the other hand, at extremely low temperatures liquids become more viscous before they reach their freezing point.

Solution: This is where viscosity index improvers (VII) are introduced. VIIs are designed to reduce the change in a lubricant's viscosity when subjected to changes in temperature. Ethylene-propylene copolymers are commonly used as VIIs.

$$\eta = \eta_0 (1 + 2.5 \frac{V_h}{V} + 1.4 \left(\frac{V_h}{V}\right)^2 + \cdots)$$
