

Arborescent Polypeptide Micelles For Drug Release

Mosa Alsehli, Mario Gauthier

IPR Symposium

May 2, 2012

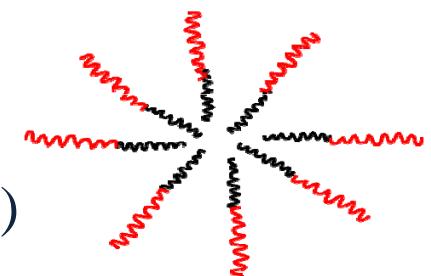

Main Project Objectives

- Synthesize biocompatible and biodegradable arborescent polymeric micelles.
- Optimize peptide coupling reactions (grafting yield and coupling efficiency)
- Demonstrate the suitability of arborescent copolymers micelles for applications in microencapsulation (drug delivery)

Polymeric Micelles

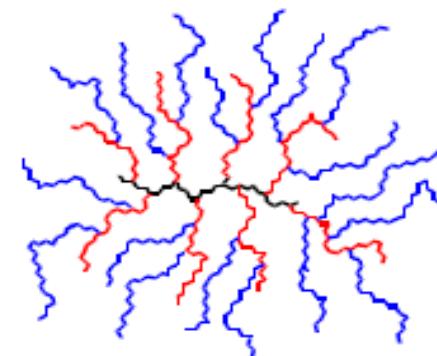

➤ Linear diblock copolymer micelles

- ✓ Dynamic structure
- ✓ Critical micelle concentration (unstable at $C < \text{CMC}$)

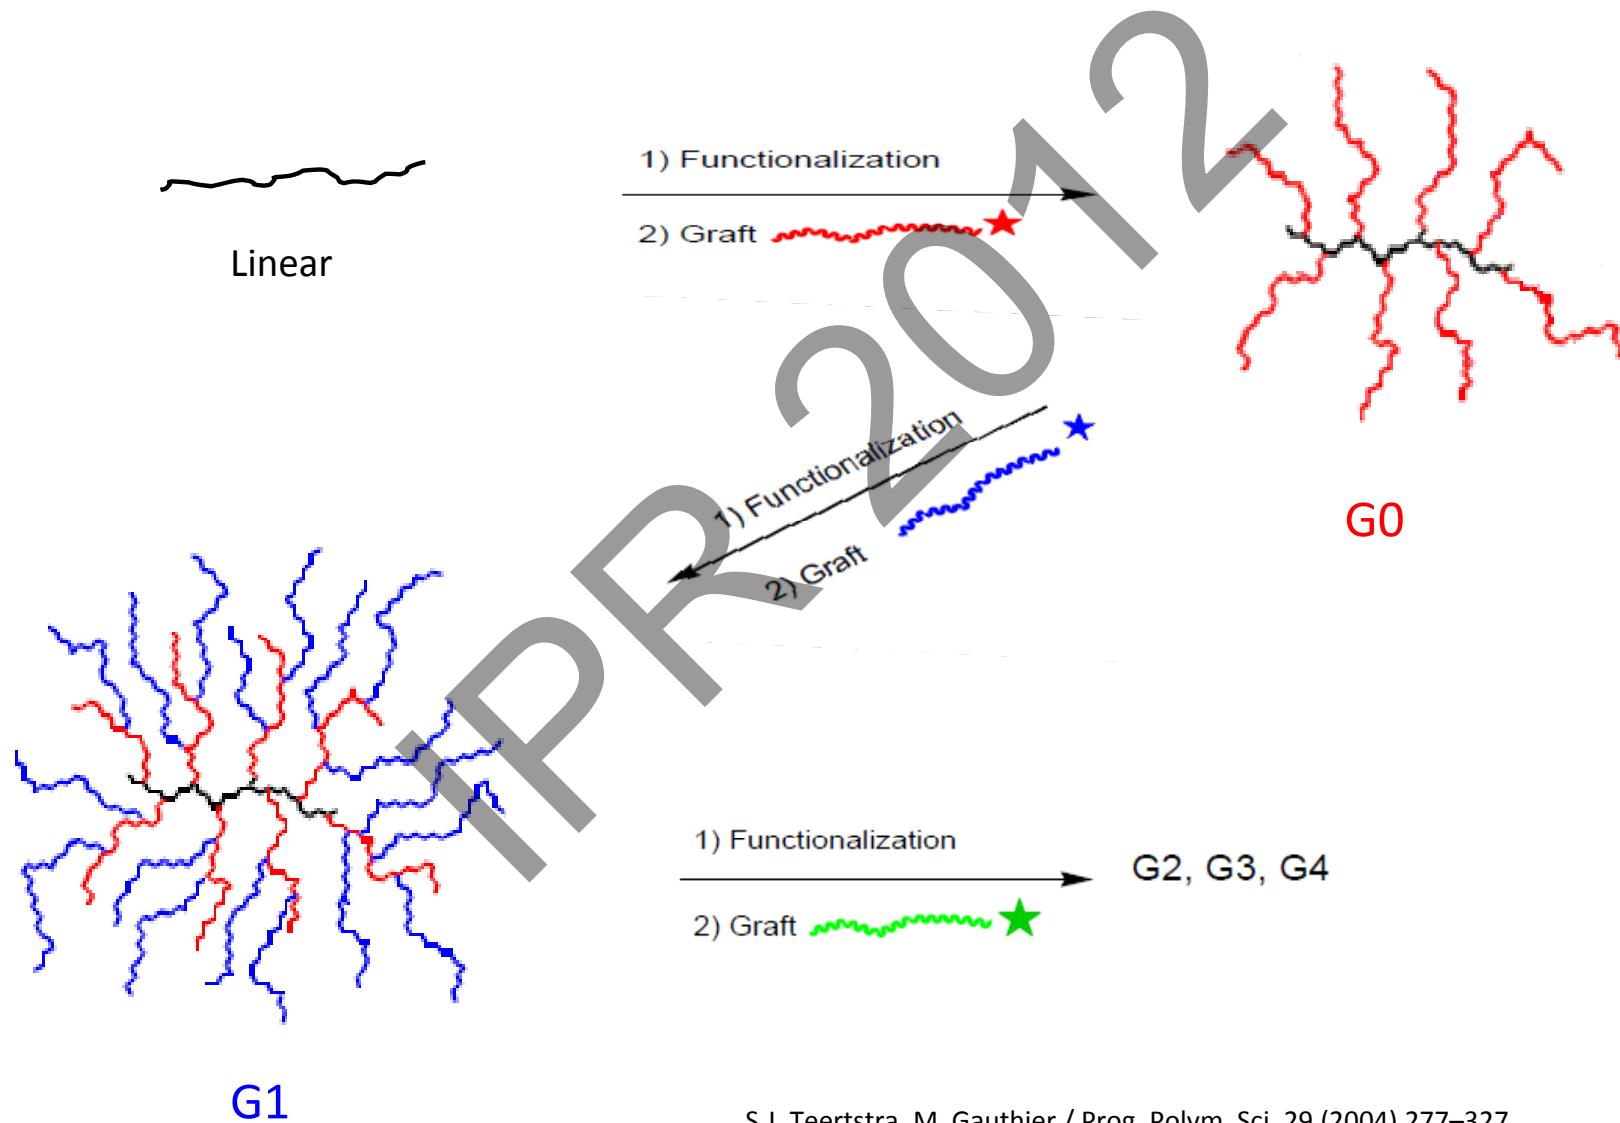

➤ Arborescent micelles

- ✓ Unimolecular (non-associated) micelles
- ✓ Static structure (stable, no CMC)

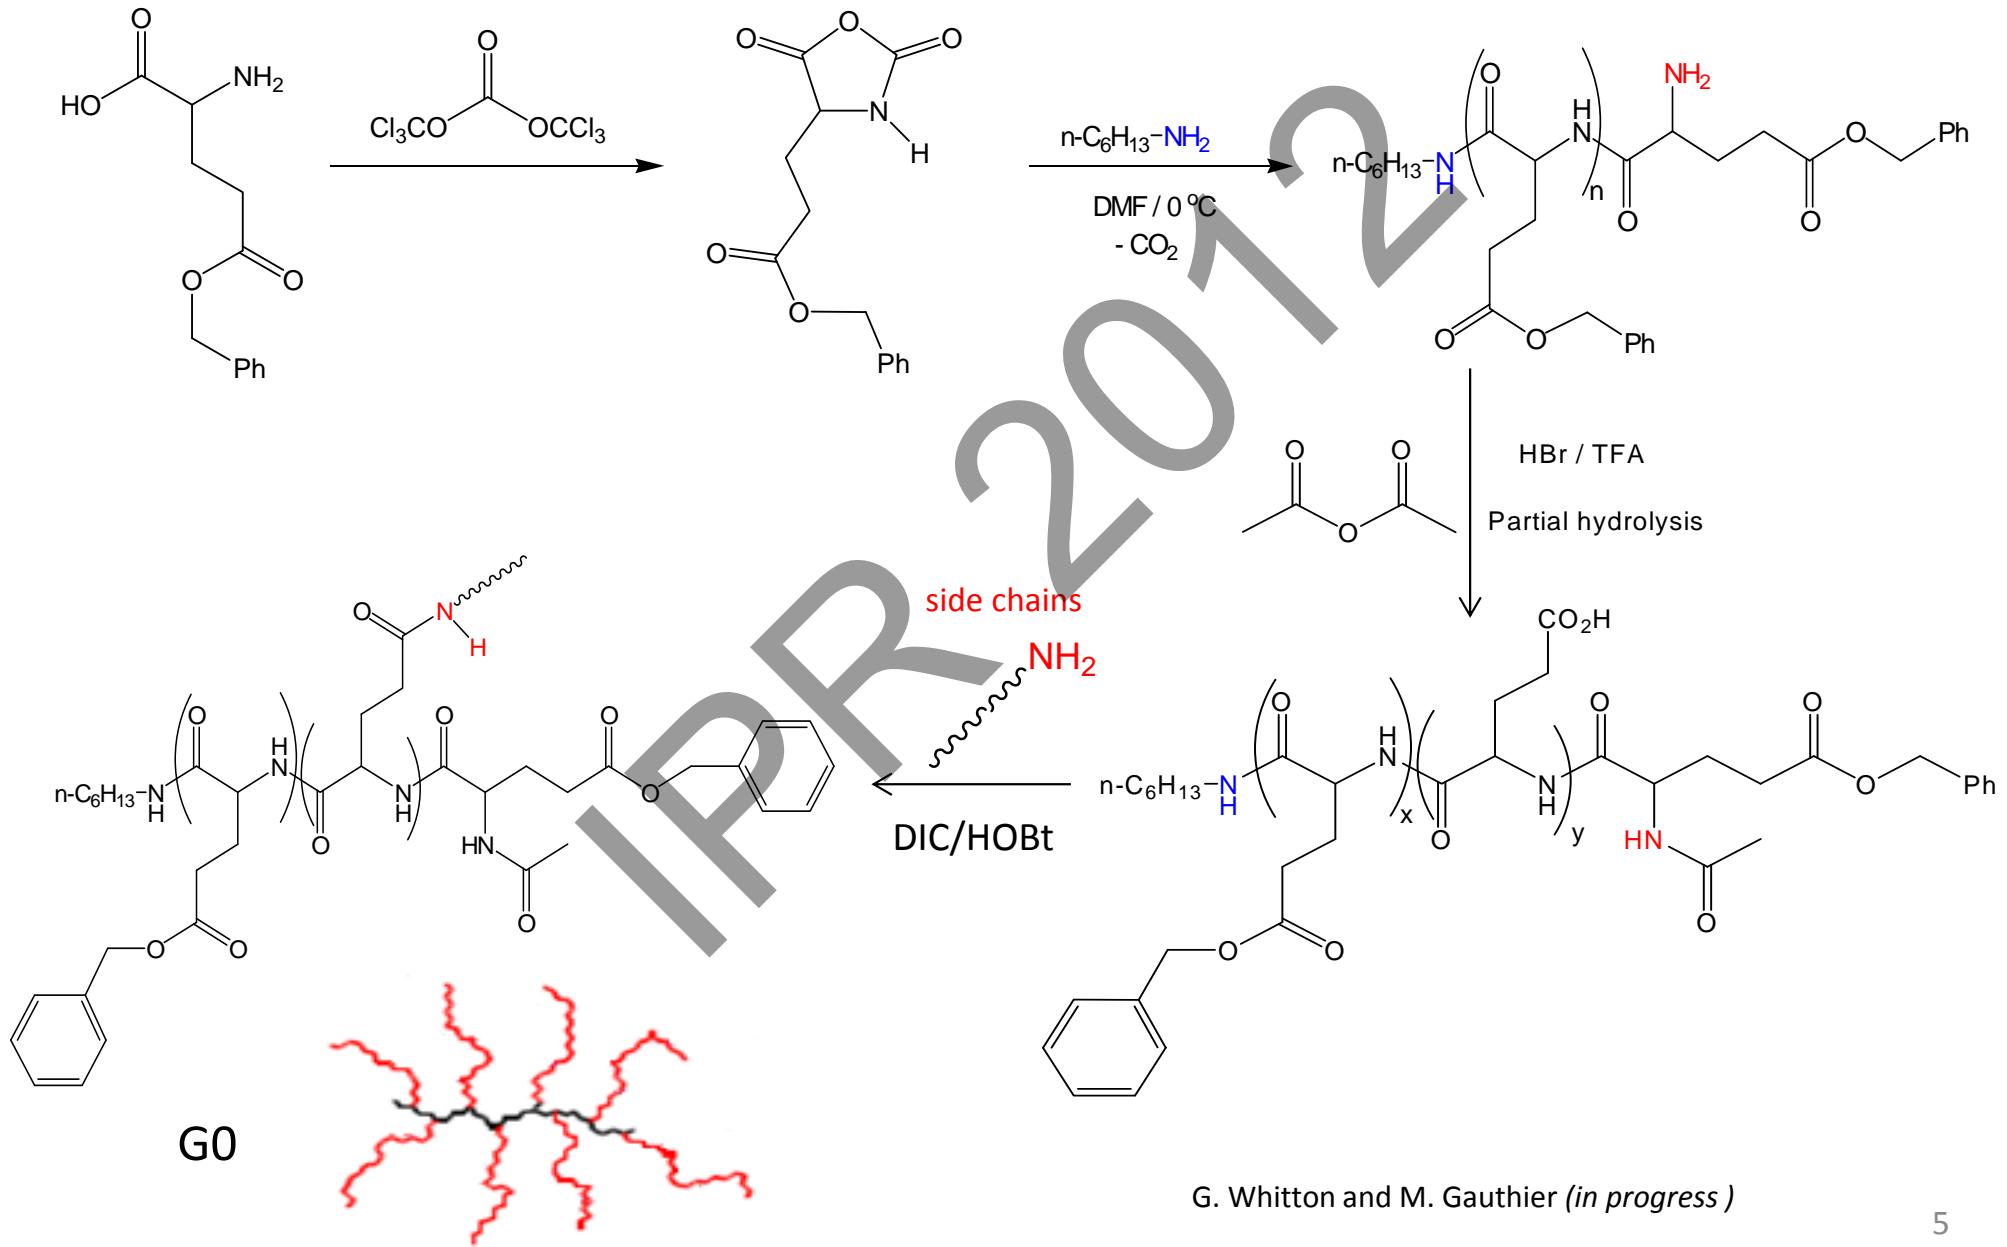

General Scheme for the Synthesis of Successive Generations of Arborescent Polymers

Overall Synthetic Scheme

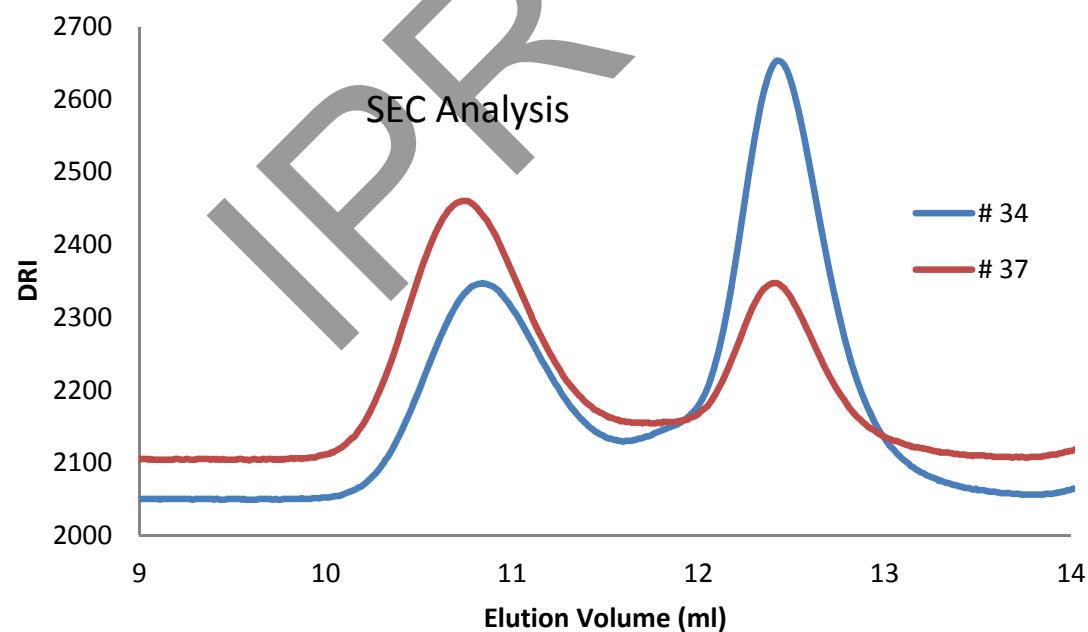

(Ring Opening Polymerization)

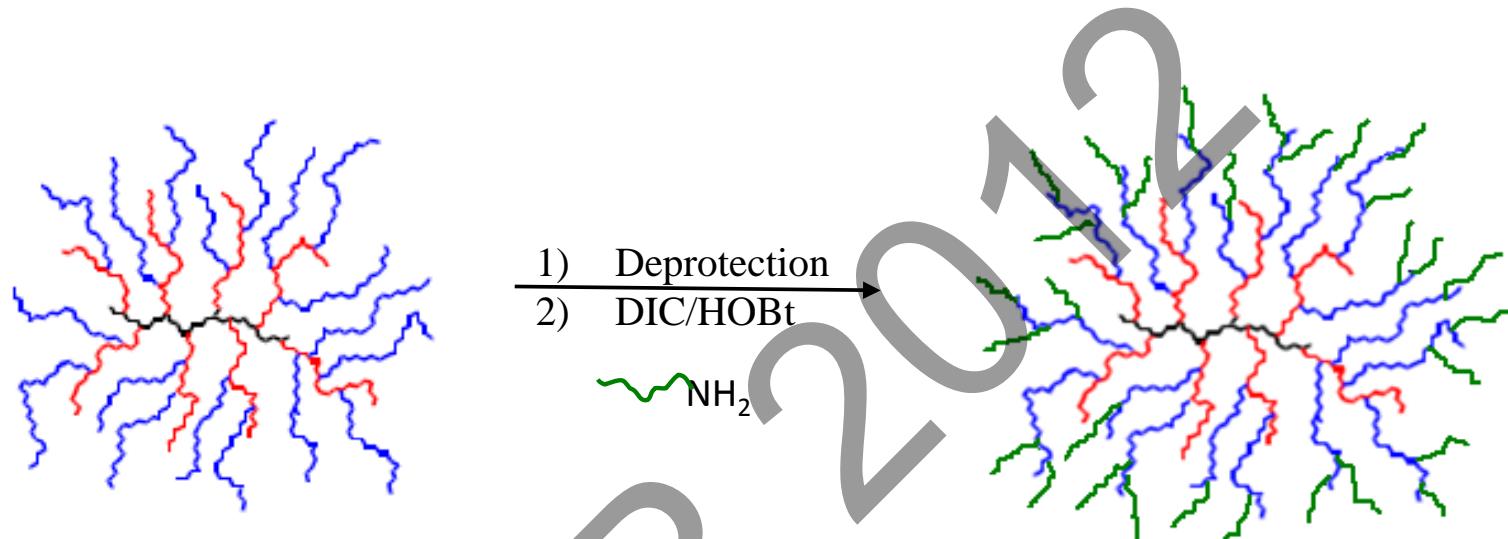

Influence of Reactants Molar Ratio on the *Grafting Yield*

Sample Name	molar ratio Side chains : substrate	MALLS		Grafting Yield (%)
		M_n	M_w/M_n	
34	1 : 0.8	67,100	1.05	40
27	1 : 1	78,400	1.03	59
37	0.8 : 1	76,000	1.07	62

T= 25 °C in all reactions, solvent= DMF, Time= 64 h, Coupling reagents= DIC/HOBt

Micelles: Shell Addition

- Last grafting cycle: Hydrophilic side chains (e.g. polyglycidol).
