

# The Personal Support Algorithm: An evidence-informed framework for allocating personal support and homemaking in Ontario's home and community care sectors

## Introduction

- People in Ontario deserve outstanding, high-quality, consistent, and integrated home community care that is delivered through provincial solutions and practice, and infor evidence and research<sup>1</sup>
- The transition from the RAI-Home Care to the interRAI Home Care assessment syst presents the opportunity to develop new evidence-informed decision support algorit guide care coordinators in planning for patient care
- Key priorities focused on guidance for eligibility, priority, and allocation of hours of period support services
- A panel of researchers from the University of Waterloo/interRAI Canada and leads Ontario Association of Community Care Access Centres (OACCAC) and Community Access Centres (CCACs) was formed

### OACCAC

Heather Binkle, Director, Client Services Janet McMullan, Client Services Aaron Jones, Sector Funding & IM Nancy Ackerman, Education Services Shelly Anne Hall, Sector Funding & IM

## **CCACs**

Gail Riihimaki, HNHB CCAC Ian Ritchie, NW CCAC Laszlo Cifra, CE CCAC Jennifer Wright, Central CCAC Valerie Armstrong, NSM CCAC Gayle Seddon, TC CCAC Amy Mangone, NE CCAC

### University of Water Dr. John Hirdes Chi-Ling Joanna Si Nancy Curtin-Teleg Leslie Eckel

Jenn Bucek

 The panel sought to develop an evidence-informed framework for supporting C Coordinators' decisions in allocating hours of personal support and homemak based on differentiating patient needs

• Principles established for this project include:

- Patient needs for the purpose of resour allocation are clearly distinguishable
- Clinical decision-making is equitable ar consistent
- Decisions are **fiscally responsible**
- Decisions are evidence-informed and the full range of tools available
- Guidelines are **practical** and **simple** to provide guidance for Care Coordinators
- Guidelines reinforce the role of clinical expertise in decision-making

## Part 1. Algorithm Development

### Data Sources

- Unique RAI-Home Care (RAI-HC) assessments in 2013 from 14 CCAC agencies in (n=128,169)
  - Excluded hospital versions, received case management or placement servi received fewer than three weeks of active service\*, top 1% of personal sup users (i.e., service maximums)
  - Linked to billed home care services calculated as weekly average of hours within 12 weeks of RAI-HC assessment
- Unique interRAI Community Health Assessment (interRAI CHA) assessments in 20 three community support service (CSS) agencies in Ontario (n=1,985)

### Allocation of Personal Support Framework

	Hours per week <sup>+</sup> (Historical numbers only)		
Group	10 <sup>th</sup> Percentile (Lower range)	50 <sup>th</sup> Percentile (Median)	90 <sup>th</sup> Percentile (Upper range)
1	0.0	0.0	1.0
2	0.0	1.7	5.2
3	0.7	3.4	11.0
4	0.9	5.7	14.0
5	1.1	7.0	16.3
6	1.9	12.0	20.6

\*Services include Nursing, Nutrition, Physiotherapy, Occupational Therapy, Speech Language Pathology, Social Work, Personal Support, and Other <sup>†</sup>Hours do not necessarily reflect the levels of service that provide the best outcomes. Service is constrained by resource availability.

nodes ("leaves") that were collapsed into six oup means and distinct percentile distributions he Personal Support Algorithm

personal support allocation and discriminates ighest group means is 32 times greater than the

across CCACs and other jurisdictions in Canada

ekly hours of personal support at the 10<sup>th</sup> and 90% percentile were retrieved ours can be used by Care Coordinators as oport hours.

rt Framework indicate ranges of hours using groups are expected to remain consistent. Further that provide best value for outcomes.

- CCAC patients generally have higher personal support needs<sup>‡</sup>
- CSS patients generally have
- lower support needs<sup>‡</sup>
- A shared Personal Support Algorithm can serve both patient groups

<sup>‡</sup>CSS patients who have been assessed with the RAI-HC and receive CCAC services generally are not assessed with the interRAI CHA

## The Personal Support Algorithm

RAI-HC Sample

interRAI CHA Sample

## Design and Sample

### Results

Design and Sample

### Results

To understand the Care Coordinato Manager experience in using the Pe Support algorithm in comparison to practice

- Current practice was most often al with outcome of the algorithm
- Ranges for weekly hours were thou be wide; however, lower and upper were useful: "The range was so wid wasn't giving much direction, but th again, it gave me flexibility"
- Provincial consistency recognized need: "Interesting getting a taste of of other CCACs. Generally speakin would be helpful because the patie experience would be similar across Ontario"

- appropriate, and consistent with current practice
- algorithm in Care Coordinator clinical practice

## Part 2. Pilot Testing

• 28 Care Coordinators from six CCACs completed 276 RAI-HC assessments, followed their normal assessment and allocation processes, and then filled out an online survey that was available 24 hours after locking their assessment

Care coordinators agreed that the Personal Support algorithm produced a clinically appropriate range 93% of the time, and that their actual allocation was in that range 89% of the time • Fewer hours were allocated usually as a result of personal preference / private pay caregiver while more hours usually

occurred because of greater patient functional complexity

- Box plot areas represent the range of hours allocated by Care Coordinators during the pilot test
- Personal support hours allocated largely match their expected ranges

## Part 3. Focus Groups

• 36 Care Coordinators and Managers (recruited from pilot testing) participated in one of two hour-long focus groups

<ul> <li>To identify strategies to address training needs for Care Coordinators and Managers in their use of the Personal Support algorithm</li> <li>Education should include discussion about the algorithm logic and how coding could affect algorithm outcomes: "Going through what are the decision points in the algorithm, same way as they train the other algorithms"</li> <li>EnterRAI competency testing should be mandatory across CCACs to support consistency with coding</li> <li>Process for requesting exceptions must be clear and have support from management: "Knowing that these are suggested hours. If it falls outside, you simply have to call your manager. It is flexible—that is the main point to get across"</li> </ul>

	gned ght to bounds <i>le that it</i> en as a <i>policies</i> g [it] nt	<ul> <li>Education should include discussion about the algorithm logic and how coding could affect algorithm outcomes: "Going through what are the decision points in the algorithm, same way as they train the other algorithms"</li> <li>interRAI competency testing should be mandatory across CCACs to support consistency with coding</li> <li>Process for requesting exceptions must be clear and have support from management: "Knowing that these are suggested hours. If it falls outside, you simply have to call your manager. It is flexible—that is the main point to get across"</li> </ul>	<ul> <li>Effective communication and change management strategies are important: "Offer opportunities to attend training, go through the scenarios, and make them confident in using the algorithm"</li> <li>Emphasize the role of the algorithm as one part of the clinical decision-making process: "It's about supporting decision-making, not making [the decision] for you"</li> <li>Present the algorithm as a guideline to promote fairness and equity within our health care system</li> </ul>

## Conclusions

• The Personal Support algorithm was developed as a framework for allocating personal support and homemaking hours for both the home and community sector and describes six distinct patient groups

• It has been validated over time in Ontario, across CCAC regions in Ontario, and other jurisdictions in Canada • Pilot testing for user acceptance indicated that Care Coordinators found the ranges to be useful, clinically

Focus groups provided important feedback that will be used to further operationalize the use of the Personal Support
